Survey Summary: Preoperative Care for Dupuytren's

Results of an anonymous survey to identify opinions on a preoperative package of care for those with Dupuytren's contracture of the hand, before their fasciectomy surgery.

Key Findings:

Range of Motion: The most important postoperative outcome for participants is the improvement in the range of motion.

Willingness to Engage: Participants are more willing to engage in preoperative splinting and massage therapy compared to exercise routines.

Information Delivery Preferences: Participants prefer receiving a wide range of information, ideally delivered face-to-face with a therapist.
